
Razorpay: one last thing we need from your dashboard

The live keys are in and the website is running on them. The only outstanding item is the payment webhook, which only you can create — about five minutes.

Aajoo Homes — Razorpay webhook

Prepared 27 September 2026 by the ZypheX Tech development team

Everything else is done and verified live

Everything else is done. The live keys are in and the website is running on them. **The only outstanding item is the webhook**, and only you can create it — the Razorpay portal is in your name. It takes about five minutes.

What a webhook is, in one paragraph

When a guest pays, Razorpay tells the browser and the browser tells us. That works — as long as the guest keeps the page open. If they pay and then close the tab, switch apps, or lose signal at the wrong moment, **the money leaves their account and nothing tells us**. The booking stays unconfirmed and the guest has paid for nothing.

The webhook is Razorpay telling our server directly, regardless of what the guest's phone did. It is the difference between "usually confirms" and "always confirms".

What to do

Make sure the dashboard is switched to **Live**, not Test — there is a toggle at the top. The screens look identical in both modes.

Settings → Webhooks → Add New Webhook

Field	What to enter
Webhook URL	<code>https://api.aajoohomes.com/webhooks/razorpay</code>
Secret	You make this up. Any long random string — 20 or more characters, letters and numbers, no spaces. Razorpay does not generate one for you, and this is the step people get stuck waiting on.
Active Events	tick <code>payment.captured</code> and <code>payment.failed</code> — nothing else
Alert Email	your own address, so Razorpay tells you if it ever stops working

Save. It should then show as **Active**.

Write the secret down before you save. Razorpay will not show it to you again afterwards. If it is lost, the webhook has to be deleted and made again.

Then send us one value

Just the **secret** you chose. Nothing else — we already have the keys.

It is not quite a password, but it is what proves a message really came from Razorpay, so please send it in a direct message rather than a group chat. You can delete the message once we confirm it is in.

What happens after that

We add it to the server, which takes a minute. Then we make **one real booking for the smallest amount and pay for it properly**, check it appears in your Razorpay dashboard, and refund it — because a test payment cannot prove live keys work.

One thing to expect: the app currently on your phone was built with the old test key, so payments in the app will not work until you install the new build we send you at the same time. The website is unaffected.
