

Switching on SMS one-time passwords

Everything on our side is built and waiting. Before a single text can be sent, Indian telecom regulation requires your business to be registered on the DLT platform and your message wording approved. This is what that involves, where to go, and what to send us at the end.

PROVIDER: MSG91 PREPARED 8 SEPTEMBER 2026 ZYPHEX TECH

Why there are forms before there are texts

Since 2021, TRAI requires every business sending automated SMS in India to register on the DLT platform — Distributed Ledger Technology, run by the telecom operators. Unregistered messages are blocked by the networks, not by us. You register your company once, register the name texts come from, and register the exact wording of the message. Only then does an OTP reach a customer's phone.

Most of the elapsed time is waiting for approvals, not doing work. Budget about a week, of which perhaps two hours is yours.

Your side

- Open an MSG91 account and add credit
- Register the company on DLT
- Register the sender name
- Register the message template
- Send us four values

Our side — already done

- SMS sending built into the backend
- Signup codes ready to go by SMS *and* email
- “Forgot password” by mobile number, working in the app
- Remaining: the same option on the website, about half a day

The six steps, in order

Each one depends on the one before it — you cannot register a template before the company is approved, and MSG91 cannot use a template that DLT has not cleared. The label on each step says whether it is a few minutes of typing or a wait for someone else to approve something.

1

Open the MSG91 account

30 MINUTES

`msg91.com` → Sign up

Register with a company email address and verify it. SMS is prepaid, so add credit to the wallet — a small starting balance is fine for testing; costs are per message sent.

Once inside, find the **Auth Key**. It is a long string that identifies your account to our server. MSG91 rearranges its dashboard from time to time; look under the API or settings area, or ask their support chat for “my auth key”.

You now have: the Auth Key. Keep it private — it can send messages and spend money.

2

Register the company on DLT

1-3 WORKING DAYS

Any one operator portal — `trueconnect.jio.com` · `dlt.airtel.in` · `vilpower.in` · `ucc-bsnl.co.in`

Pick *one*. Registering with a single operator propagates to all the others, so there is nothing to gain from doing it four times. Jio and Airtel are the ones most businesses use.

Have these ready before you start:

- Company PAN
- GST certificate, or Certificate of Incorporation
- PAN and Aadhaar of the authorised signatory
- An authorisation letter on company letterhead

Some operators charge a one-time registration fee. MSG91's support team does this with clients regularly — if any field is unclear, ask them rather than guessing, because a rejected application restarts the wait.

You now have: a **Principal Entity ID**

(PEID) — a long number identifying your company across all networks.

3

Register the sender name

1-2 WORKING DAYS

Same DLT portal → Headers

This is the six characters a customer sees instead of a phone number. It must be exactly six letters, no digits, for this kind of message. Something like **AJJOH** reads naturally as Aajoo Homes.

Register it as **transactional** or **service**, never promotional. Promotional headers are blocked during Do-Not-Disturb hours, and a customer trying to log in at ten at night would simply never receive their code.

You now have: an approved **Sender ID** .

4

Register the message wording

SAME DAY - 2 DAYS

Same DLT portal → Content Templates → category: Service Implicit

This is the step to get right first time. The text you register is the text that gets sent — the network compares them character by character and rejects anything that differs. Changing it later means going through approval again.

Register exactly this, including the full stops:

CONTENT TEMPLATE - COPY CHARACTER FOR CHARACTER

`{#var#}` is your Aajoo Homes verification code. It is valid for 5 minutes. Do not share it with anyone.

! One variable only. Our server sends just the code, so a template with a second `{#var#}` will fail. Five minutes is the real expiry in our system — if you prefer different wording, tell us before you register it, and we will match our side to yours.

AAJ00H · now

483920 is your Aajoo Homes verification code. It is valid for 5 minutes. Do not share it with anyone.

One template covers both signing up and resetting a password, which is why the wording says “verification code” rather than naming either. If you would rather the two read differently, register two templates and send us both IDs — we will wire the second one up.

You now have: an approved **DLT template ID** .

5

Connect DLT to MSG91

20 MINUTES

msg91.com dashboard → the DLT or Sender ID area

Back in MSG91, enter your Principal Entity ID and sync your approved header and template across. MSG91 then issues its own **template ID** for the message — this is the one our server needs, and it is not the same as the DLT template ID from the previous step.

If the sync shows nothing, the DLT approval has usually not finished propagating. Wait a few hours before assuming something is wrong.

You now have: the **MSG91 template ID** — the last of the four values.

6

Send us the four values

5 MINUTES

That is your part finished. Send these across and we will have SMS live within the hour.

WHAT WE NEED	WHERE IT CAME FROM	LOOKS LIKE
SMS_PROVIDER	Fixed — no action needed	msg91
MSG91_AUTH_KEY	Step 1	a long mixed string
MSG91_SENDER_ID	Step 3	AAJ00H
SMS_OTP_TEMPLATE_ID	Step 5	a long numeric ID

The Auth Key is a live credential — anyone holding it can send messages against your balance. Please send it through a password manager share or a call rather than a group chat. It can be regenerated in MSG91 if it is ever exposed.

What happens the moment we have them

No new app release, no website deployment, no downtime. The code is already live and waiting for these values.

FEATURE	TODAY	AFTER
Signup code	Email only	SMS <i>and</i> email — email stays as backup, so a network problem cannot block a signup
Forgot password, app	Says SMS is not available	Accepts a mobile number and texts the code
Forgot password, website	Email only	Same as the app — this is the half-day of work on our side

Testers can confirm it end to end in a few minutes: sign up with a real Indian mobile number and check the message arrives, reads correctly, and the code

works.

Where applications usually get rejected

Four things account for most delays. All are avoidable.

- **A sender name registered as promotional.** Codes then stop arriving overnight, when guests most often reset a password.
- **Template text that does not match.** A changed full stop or an extra word is enough for the network to drop the message.
- **Company name mismatched.** The name on DLT must match the GST or incorporation certificate exactly, not a trading name.
- **Two variables in the template.** Our server sends only the code. Anything expecting a second value will fail at send time, after approval, which is the most confusing way to discover it.

Realistic timeline

STAGE	ELAPSED	YOUR EFFORT
MSG91 account and credit	Day 1	30 min
DLT company registration	Days 1–4	45 min
Sender name approval	Days 4–6	10 min
Template approval	Days 5–7	15 min
Linking, and handing us the values	Day 7	25 min
Live and testable	Day 7	—

Approval times are the operators', not ours, and they vary. Starting step 2 today is what shortens the whole thing — everything after it is queued behind that approval.

Prepared by ZypheX Tech for Aajoo Homes. Any question on this document, or on a form that will not accept something, is quicker to ask than to work around — a rejected DLT application costs days, and every one of them is avoidable.
