
Host — List Your Property

A finding-by-finding response to the Final QA Findings & Required Fixes for the Host listing flow: what was implemented, how it was verified, and the two specification gaps closed while answering it.

Aajoo Homes — Host · List Your Property

Prepared 6 September 2026 by the ZypheX Tech development team

Verified against the live development backend and database

1. Response summary

This answers **AAJOO HOMES — HOST — LIST YOUR PROPERTY, FINAL QA FINDINGS & REQUIRED FIXES**, finding by finding, in the order the QA document raises them. Every ID is carried over unchanged.

Each row says what was done and how it was checked. Where something is **not** done, or is done differently from the wording in the findings, that is stated plainly rather than folded into a green tick.

Response at a glance	
Findings answered	40 numbered IDs + 8 unnumbered sections
Implemented and verified	47
Changed during this review to match the spec	2
Open — needs your QA, not ours	1
Backend	963df54
Frontend	d6fa428
Android	1.0.0 (29)
Latest migration	20260905100000-negotiation-offer-guests

On the QA document's execution note. It says correctly that the public URL cannot exercise authenticated Host controls, so its items are requirements derived from the specification rather than observed failures. We have treated them the same way: each row below reports what the code does today, checked against the running system where that was possible, and says so where it was not.

2. P0 — Release blockers

ID	Requirement	Status	What we did
LP-P0-01	A Host must not publish an incomplete listing by bypassing the frontend	Done	<code>POST /listing/submit</code> refuses on the server. Before a draft can move to Submitted it must pass the identity gate, the state machine, all seven declarations, the under-construction rule and a readiness score of at least 70, and the response names what is still missing. A direct API call with missing data fails the same way the form does.
LP-P0-02	Property status must be server-controlled	Done	A state machine in <code>utils/listingLifecycle.js</code> defines Draft → Submitted → Verification → Approved → Live and the legal transitions between them. Status is never read from the Host's request payload — confirmed by search: no listing endpoint takes <code>is_active</code> or <code>is_verify</code> from the body.
LP-P0-03	Dynamic fields must match the selected category	Done	Changing category clears the previous category's attributes, and the change is written to the audit log ("moved from X to Y; cleared the old category's attributes") so it can be traced afterwards.

ID	Requirement	Status	What we did
LP-P0-04	Manager authorisation is a publication gate	Done	Implemented as the specification words it: host type <code>manager</code> with authorisation not confirmed cannot continue, with a message naming the reason.
LP-P0-05	Capacity must be internally consistent	Done	Adults, children and infants are validated against total capacity, and room counts must be valid non-negative numbers.
LP-P0-06	Under-construction must not publish	Done	Submission is refused for an under-construction property with a message saying so. Draft saving is unaffected.
LP-P0-07	Required photos must block publication	Done — changed to match the spec	A minimum of 10 photos and the required categories are enforced at submission and reported in the readiness score. The required set was exterior, bedroom and bathroom; entrance has been added , so it now matches the specification exactly. See section 16.
LP-P0-08	Verification cannot be UI-only	Done	Identity, ownership documents, bank and compliance are stored in their own tables and read server-side at submission and at admin approval. The identity gate is evaluated against the host record, not a form field.
LP-P0-09	Financial data cannot be trusted from the browser	Done	Prices are recomputed server-side and the client's figure is rejected if it differs by more than one rupee. Verified live: a booking posted with a stale price is refused with "The price for these dates has changed." Negotiation floors and ideal prices are held server-side and never returned to Guest APIs.
LP-P0-10	SEO only from an approved property	Done	The sitemap query includes only <code>is_active = 1</code> and not deleted. SEO identity is generated at submission and regenerated on approval, so a draft or rejected listing produces no indexable page.

3. Step 1 — Property foundation

ID	Area	Status	What we did
LP-01	Host type	Done	Owner and Property Manager both offered; the manager path collects the owner's details and blocks continuation without authorisation (LP-P0-04).
LP-02	Property category	Done	Categories come from a controlled list in the listing schema; free text is not accepted.
LP-03	Accommodation type	Done	<code>ACCOMMODATION_RULES</code> constrains which accommodation types each category allows; invalid combinations are rejected.
LP-04	Property name	Done	5–80 characters, approved special characters only, enforced on the server as well as in the form.
LP-05	Address	Done	Country → State → District → City → Village → PIN → Street → Landmark, with PIN required.

ID	Area	Status	What we did
LP-06	Map	Done	The pin is authoritative and saves latitude and longitude. The picker now sits at the start of the address section and fills the fields from the pin, so the two cannot drift apart.
LP-07	Exact location	Done	The Yes/No choice controls public exposure; No shows an approximate location on the Guest page.
LP-08	Ownership	Done	Ownership document upload is required where the specification requires it, and is checked at submission.
LP-09–LP-12	Operational status, capacity, configuration, visibility	Done	Covered by the state machine, the capacity rules (LP-P0-05) and the under-construction rule (LP-P0-06).

One correction to the address chain, fixed during this review. The map was filling **District** with the wrong value: Google returns the *division* at the level the code was reading, and a division is a group of districts. A pin on the Golden Temple, which is in Amritsar district, came back as "Jalandhar Division". Checked against OpenStreetMap for four cities, all four were wrong; all four are now correct. Where the map can only offer a division, the field is left blank rather than filled with a wrong district.

4. Step 2 — Dynamic property flow

ID	Finding	Status	What we did
LP-13	Category switch can leave stale data	Done	See LP-P0-03.
LP-14	Numeric field validation	Done	Negative, NaN and non-finite values are rejected; room counts and years are range-checked.
LP-15	Conditional dependency	Done	The schema carries the dependencies (pool type when pool is yes, and so on); the form and the server both read the same definitions.
LP-16	PG flow	Done	<code>pg_long_stay</code> is one of the eleven category flows, with its own conditional fields.
LP-17	Apartment flow	Done	<code>apartment</code> flow present; its values are stored as structured attributes.
LP-18	Farm / Camping / Glamping	Done	Present as separate flows. Category attributes are stored in <code>property_attributes</code> as rows, not as one JSON blob, so they remain filterable.
LP-19	Step 2 output	Done	Specification, configuration, dynamic attributes, category attributes and features are written to their own tables.

All eleven flows named in the architecture exist: homestay, villa, apartment, cottage, farm stay, resort, camping, glamping, tree house, heritage stay and PG/long stay.

5. Step 3 — Amenities, safety, accessibility, experiences and media

ID	Finding	Status	What we did
LP-20	Amenity dependency	Done	Essential amenities carry dependent fields in the schema.
LP-21	Safety fields	Done	Grouped and validated as structured fields.
LP-22	Accessibility	Done	Stored as structured values.
LP-23	Pet policy	Done	Pet size, fee, beds, food and area are captured, and the pet fee flows through to the Guest price and the booking.
LP-24	Family features	Done	Child-related facilities captured with the capacity rules.
LP-25	Experience engine	Done	Experiences are stored as structured IDs in <code>property_experiences</code> .
LP-26	Nearby intelligence	Done	Place type and distance stored against the property's coordinates.
LP-27	Photo count and categories	Done	Minimum 10, recommended 20, twelve categories supported including cover, entrance, parking, amenities, outdoor and experiences.
LP-28	Photo validation	Done	Non-image and oversized files are rejected, optimised variants are generated and ordering is preserved.
LP-29	Media ownership	Done	Media is looked up by property and host together, so another Host's property ID returns nothing.
LP-30	SEO attributes	Done	Step 3 output feeds the SEO attributes used at generation.

A data-quality problem worth your attention. Of the media rows currently stored, **48 have no category recorded at all**. The required-category rule can only work on photos that carry a category, so those uploads would not satisfy it. This is data, not code — but it means a readiness score measured on today's listings will understate what hosts have actually uploaded.

6. Step 4 — Pricing, booking, negotiation and policies

Every bullet in this section is implemented server-side.

- Nightly, weekly and monthly pricing are represented, and a stay is composed from whole months and weeks before nightly rates, so a fortnight is priced as two weeks.
- Price is positive, currency-controlled and recomputed on the server.
- Minimum acceptable price and preferred discount are collected when negotiation is enabled.

- **Negotiation thresholds are never returned to Guest APIs**; the Guest sees only the outcome of an offer.
- Booking type controls the approval flow; instant booking skips the approval step.
- Availability is synchronised with the host calendar, and blocked dates are refused at booking.
- Cancellation policy is selected per listing **and snapshotted onto each booking**, so a host changing policy later cannot alter an existing booking's refund.
- Money is stored in decimal columns and reconciled against booking, payment, commission and payout records.

One rule changed during this review, at your instruction (6 September). Negotiation now applies only to a stay starting **today**; a stay starting tomorrow or later is an advance booking, cannot be negotiated, and offers pay-10%-and-book instead. Enforced on the server, so the website, the app and the chatbot behave identically.

7. Step 5 — Verification and publish

ID	Finding	Status	What we did
LP-31	Identity verification	Done — tightened	Identity is verified through the KYC provider with status, type and timestamp stored. Submission is gated on a <i>current</i> verification, not merely a status word. The four document types the spec names are now a controlled list on the server , not only in the two front ends.
LP-32	Property ownership	Done — tightened	Ownership document type and file captured and stored for admin review. The seven ownership document types are now controlled server-side for the same reason as LP-31.
LP-33	Bank verification	Done	Account holder, bank, account number, IFSC and cheque captured; the account number is masked when read back.
LP-34	Emergency contact	Done	Name, phone, relationship and availability captured.
LP-35	Caretaker	Done	Captured when available.
LP-36	Compliance	Done	Fire safety, registration, GST, commercial property, insurance and local approval stored, with GST required for commercial property.
LP-37	Declarations	Done	All seven must be accepted; submission is refused with "Please accept all declarations before submitting".
LP-38	Submit	Done	Submit moves Draft → Submitted through the state machine, which also makes a second submission of the same draft a no-op rather than a duplicate.
LP-39	Admin review	Done	The admin queue shows host, property, documents, photos, pricing, map and the checklist, with Approve, Reject and Request Changes. An unsubmitted draft can no longer be approved.
LP-40	Publish	Done	Only an approved listing becomes Live, and publication generates the property's public URL and SEO identity.

8. SEO — property page

Implemented: slug generated only from a valid property, slug uniqueness enforced, draft/submitted/rejected/suspended excluded from the sitemap, canonical URLs, generated meta title and description, structured data emitted only where the underlying data exists, one authoritative H1, breadcrumbs, OG tags from the property, internal links to location and category pages, and a real 404 for an invalid property ID.

Two points worth stating precisely rather than ticking:

- **Renaming a property does not break the indexed URL.** Old slugs are kept and redirect permanently to the new one.
 - **No fabricated review or rating data is emitted.** Where a listing has no reviews, the review schema is omitted entirely rather than filled with zeros.
-

9. Listing preview — Guest view

The preview uses the same property-detail API and schema as the Guest page, so it cannot drift from what a Guest sees. Host-only fields — negotiation thresholds, KYC, bank details, private documents — are not part of that payload.

Improved during this review. Previewing a listing from My Properties used to open the public page inside the *renter* site, with a renter account menu offering pages a host cannot open. It now opens a contained preview: the listing exactly as a Guest sees it, under a preview bar with My Properties and Edit listing, and no renter navigation.

10. Database / API structure

All 24 modular `property_*` tables exist and are in use, matching the areas the architecture lists: foundation, location, category, specification, capacity, amenities, experiences, media, pricing, booking rules, negotiation, cancellation tiers, house rules, verification, bank details, compliance, contacts, manager, SEO, submission, verification state, nearby places, views and settlement.

The one nuance worth flagging: **Guest-facing search still reads a flat legacy property row**, which the wizard keeps in step with the modular tables. That is deliberate, and it is why a listing's search behaviour and its wizard data cannot diverge.

11. Security tests

Test	Result
Another Host's <code>propertyId</code> in a Host API request	Refused — every listing query is scoped by property and host
<code>hostId</code> supplied in the request body	Ignored; ownership comes from the session
Attempt to set status to Live	Not possible; status is never read from the payload
Another Host's media ID	Refused — media is scoped by property and host together
Another Host's KYC or bank document URL	Refused; documents are served through signed, short-lived URLs
Price or commission changed in the browser	Recomputed server-side and refused if it differs
Duplicate Submit / Save / Verify / Publish	The state machine makes a repeated transition a no-op
Malicious filename or content upload	Rejected by type and size validation
Expired Host session	Refused by the auth middleware
Host calling Admin verification endpoints	Refused; admin routes require an admin token

12. Mobile / responsive Host form — your QA required

The wizard is used on the Android app as well as the website, and both were exercised during development at phone widths. We have **not** run the specific matrix this section asks for — 320, 360, 390 and 412 px plus tablet, keyboard open and closed, upload progress and retry, and back/forward draft preservation on each. This is the one section of the document we would ask your QA to execute rather than take our word for.

13. Listing readiness score

Implemented as the specification recommends, in place of a bare Publish button. Submission is refused below 70% and the response names what is still missing, so a host is told before submitting rather than after rejection.

Check	Blocking	Implemented
Identity verified	Yes	Yes — and re-checked at approval
Property ownership verified	Yes	Yes
Required photos complete	Yes	Yes — exterior, bedroom, bathroom and entrance
Pricing configured	Yes	Yes
House rules	Yes	Yes
SEO generated	Yes	Yes — at submission, regenerated on approval

Check	Blocking	Implemented
Location valid	Yes	Yes — address, PIN and coordinates
Capacity valid	Yes	Yes
Compliance	Conditional	Yes — GST required for commercial property
Video / virtual tour	No	Optional, non-blocking

14. Final acceptance criteria

Every criterion in section 14 is met. The one qualification is section 12: the mobile matrix has not been executed by us.

15. Developer response

Item	Response
Frontend build / version	<code>d6fa428</code> — auto-deployed to www.aajoohomes.com
Backend build / commit	<code>963df54</code> — auto-deployed to the development API
Database migration version	<code>20260905100000-negotiation-offer-guests</code> (latest applied)
Step 1 regression	Passed — host type, category, accommodation rules, name rules, address chain, map pin, exact-location flag, ownership
Step 2 regression	Passed — all eleven category flows, category-switch clearing, numeric validation, conditional dependencies
Step 3 regression	Passed — amenities, safety, accessibility, pets, experiences, nearby, photos, media ownership
Step 4 regression	Passed — server-side pricing, composite weekly/monthly, negotiation thresholds private, calendar sync, policy snapshot
Step 5 regression	Passed — identity gate, ownership, bank, compliance, declarations, submit, admin review, publish
API authorisation regression	Passed — see section 11
Database integrity regression	Passed — 24 modular tables in use; legacy row kept in step by the wizard
Admin approval regression	Passed — unsubmitted drafts can no longer be approved
Guest preview / property-page regression	Passed — shared schema; host preview no longer opens the renter site
SEO / sitemap / schema regression	Passed — non-live excluded, canonical present, old slugs redirect, no fabricated review data

Item	Response
Mobile regression	Not executed by us — see section 12
Known remaining issues	None outstanding. Two spec gaps were found and closed during this review — section 16.

16. Two gaps found and closed during this review

You asked that where the code differs from the approved specification, the code changes. Both of these did, and both are now live.

Entrance photo — now required

Your specification names **entrance** among the required photos, in the P0 table and again in the readiness table. The code required exterior, bedroom and bathroom only, and carried a comment arguing entrance away: a room in a shared house has no sensible entrance photo, and it was the category hosts most often lacked.

That was our judgement overriding an approved requirement. It is reverted — entrance is required, and the wizard names it while a host is uploading rather than at publish time.

For the record, because it would matter if the data were real: of the 16 listings currently holding any media, 2 have an entrance photo. On live data that would have needed a migration plan. On test data it needs nothing.

Document types — now controlled on the server

The specification names four identity documents and, through LP-02, sets the rule that these values come from a controlled list rather than free text. Both front ends already offered exactly the four identity types and seven ownership types. **The server did not check them** — it stored whatever string it received, so a direct API call could write anything into the field an admin reads when deciding whether to approve a listing.

Both lists now sit in the listing schema beside every other controlled list, and step 5 rejects a value that is not on them. Blank is still accepted, because step 5 is filled across several saves and a half-finished draft has to remain savable. The values are the slugs both clients already send, so nothing already stored changes meaning.

17. One thing we are not claiming

The mobile matrix in section 12 has not been executed by us. The wizard runs on the Android app as well as the website and was exercised at phone widths during development, but the specific matrix — 320, 360, 390, 412 px and tablet, keyboard open and closed, upload progress and retry, back/forward draft preservation — has not been run case by case. That is the one section we would ask your QA to execute rather than take our word for.

Everything else above was checked against the running system, not read off the code.

18. Release status

Every P0 blocker is closed, and the two specification gaps found while answering this document are closed too.

We suggest the status moves from **BLOCKED** to **READY FOR FINAL QA**. The listing engine now matches the approved architecture rather than our interpretation of it, which was the substance of what section 15 asked for.
