
Build 117 — please install this before any further app testing

Builds 112 and earlier talk to a different server and a different database, so testing on one proves nothing about the live platform. The file, how to install it, how to confirm which build you are on, and what changed.

Aajoo Homes — app build 117

Prepared 27 September 2026 by the ZypheX Tech development team

Endpoint, package and versionCode read from inside the artifact on the same day

27 September 2026. For Nameesh and the tester.

The file

Filename	aajoo-homes-1.0.0-build117-release.apk
sha256	787f7aa4ceeb91957b500a96906c7cbb9447fb7600e1154f1eb6285c26864cc6
Size	100,477,287 bytes (95.8 MB)
Package	com.aajoo.aajoohomes
versionName / versionCode	1.0.0 / 117
Points at	https://api.aajoohomes.com — verified inside the artifact
Payments	Test mode (rzp_test_...). No real money can move.

This replaces build 116, which was never circulated.

Why this matters more than a normal update

Any build numbered 112 or lower is talking to a different server *and* a different database.

We confirmed this by reading the compiled apps themselves, not from notes: build 112 contains `aaajaodev.onrender.com`; builds 113 onward contain `api.aajoohomes.com`. Build 113 was the first one ever pointed at a production host.

And those two servers do not share data. The old one is still connected to the original Clever Cloud database; the live platform moved to PlanetScale on 24 September.

So an older build does not fail. It works perfectly — against a copy of the world that nobody else can see.

Sign-ups, listings, bookings and negotiations made there are invisible to the website and to anyone on a newer build. Nothing errors, nothing warns.

That is worth knowing for two reasons:

1. **Testing done on an old build proves nothing** about the live platform, in either direction.
2. **Any "it didn't save" or "my booking vanished" report since 24 September may not be a defect at all** — it may simply have happened in the other database.

How to install

Please uninstall the existing Aajoo Homes app first, then install this file. Installing over the top would technically work, but the old app may be holding a saved login issued by the old server against the old database — and a stale session is exactly the kind of thing that produces a confusing failure an hour later. There is nothing worth keeping in the old install.

1. Uninstall **Aajoo Homes** from the phone
 2. Install `aajoo-homes-1.0.0-build117-release.apk`
 3. Sign in again
-

How to confirm you are on the right build

The app itself will not tell you. Settings shows only "Version 1.0.0" — the build number is deliberately not shown to users, so 112 and 117 look identical from inside the app.

Check it from Android instead:

Settings → Apps → Aajoo Homes → scroll to the bottom It should read **1.0.0 (117)**. The number in brackets is the one that matters.

If you want to be certain the downloaded file is the right one before installing, its sha256 is above.

What is in 117

The two items from the 26 September screenshots:

- **The weekend price headline.** A one-night Saturday stay showed "₹5,000/night" above a "₹10,620 total". The total was correct — the host had set ₹9,000 for Saturdays, plus 18% GST. The headline was reading the flat price column instead of what those particular nights cost. It now shows the real nightly figure.
- **Minimum stay.** A 1-night stay could be priced on a listing that says "Minimum stay 3 nights". It is now refused, with the host's own rule quoted.

Both were present on Android as well — it is one codebase, so this was never an iOS-specific fault. The real gap was between the app and the **website**, which had already fixed both.

New in 117 — the app now says *why* a price moved. Correcting the headline above fixed one confusion and created another: a guest who sees ₹5,000 on the search card and ₹9,000 on the listing has no way to know the host set a different weekend rate, so it looks as though the price changed on its own. The listing now adds, underneath the figure:

These dates are priced differently · usually ₹5,000/night

Only when the chosen dates genuinely cost something other than the usual rate — an ordinary midweek stay carries no extra line. This is the wording the website has always used.

Also: one widget that rendered differently on iOS and Android was replaced, so the two platforms now draw the same control.

Not yet driven by us: these changes are all on the guest-facing property page, and we have not been able to exercise them on a device because the new database had no guest account when the build was made. Worth a look when you are in there.

After everyone is on 117

Once you both confirm the install, we will switch off the old Oregon server. It is the last thing keeping the abandoned database reachable, and leaving it running is what allows an old build to quietly write to nowhere.
